

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a tool constructed out of high quality materials meant to be able to endure the most demanding procedures and work environments. This particular piece of equipment could enable the individual driving to operate the forks hydraulically without leaving the seat. Side shifting models have the extra ability to be able to laterally position the arms or the entire load so as to facilitate much more precise carrying and position in a faster and much more efficient manner.

The only one of its kind blade pocket design can enable the person operating it to be able to safely swing the unit's blades without any worry of destroying the positioning cylinders. This can allow the operator the option to either execute simultaneous or independent fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into blade positioners on existing units.
